Amendments to the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently amended) A catheter apparatus for the therapeutic embolization of aneurysms, the catheter apparatus comprising:

a catheter configured to inject a filling material into the aneurysm;

an active locator attached to <u>a tip of</u> the catheter and configured to provide coordinates to determine a spatial position and/or orientation of the catheter;

a pump configured to controllably supply filling material to the catheter; and

a monitor connected to the active locator and the pump, wherein the monitor is configured to monitor the spatial position and/or orientation of the catheter based on the provided coordinates from the locator to detect emergence of the tip of the catheter from the aneurysm during the injection of the filling material into the aneurysm, and configured to stop the supply of the filling material in response to the detected emergence.

2. (Previously presented) The catheter apparatus as claimed in claim 1, wherein the active locator comprises a magnetic field sensor.

3-4. (Canceled)

5. (Currently amended) An apparatus for the therapeutic embolization of aneurysms, the

apparatus comprising:

a catheter for injecting a filling material into an aneurysm;

a locating device and at least one active locator fitted on a tip of the catheter, the

locating device providing coordinates for determining a spatial position and/or orientation of

the locator;

a pump device for controllably supplying filling material to the catheter; and

a monitoring unit connected to the locating device and the pump device, the

monitoring unit is operative to monitor the spatial position and/or orientation of the catheter

based on the provided coordinates from the locator to detect emergence of the catheter

from the aneurysm during the injection of the filling material into the aneurysm, and

thereupon stopping the supply of the filling material.

6. (Previously presented) The apparatus as claimed in claim 5, wherein the monitoring unit

comprises a memory having a road map stored therein, and a recorder for recording the

measured position of the locator using the road map.

7. (Previously presented) The apparatus as claimed in claim 5, further comprising an X-ray

device.

8. (Currently amended) The apparatus as claimed in claim 5, wherein the locating device

3

determines the position and/or orientation of the tip of the active locator by at least one of a

mechanical, electromagnetic, optical and/or acoustic method.

9. (Previously presented) The apparatus as claimed in claim 8, wherein the active locator

comprises a magnetic field sensor and the locating device comprises a field generator for

generating an electromagnetic field which is spatially and/or temporally inhomogeneous.

10. (Previously presented) The apparatus as claimed in claim 5, wherein the filling material

is selected from at least one of a curable polymer material, plastic beads, a plastic coil, a

hydrogel and/or a fibrin sponge.

11. (Currently amended) A method of controlling the supply of a plugging material to a

catheter employed in the therapeutic embolization of an aneurysm, the method comprising

the acts of:

determining a position and/or orientation of a tip of the catheter from coordinates

provided by an active locator fitted thereon;

automatically monitor the spatial position and/or orientation of the catheter based on

the coordinates provided by the locator; and

stopping the supply of the plugging material to the catheter if emergence of the

catheter from the aneurysm is detected based on the monitored spatial position and/or

orientation of the catheter.

Patent Serial No. 10/598,567

Amendment in Reply to Final Office Action of May 11, 2011

12. (Previously presented) The method as claimed in claim 11, comprising an act of

recording the position of the locator in a road map of locator positions, the detecting of the

emergence of the catheter from the aneurysm further being based on the road map.

13. (Previously presented) The method as claimed in claim 11, wherein the catheter and

the aneurysm are imaged together at the start of embolization, by at least one of X-rays

and administration of a contrast agent.

14. (Previously presented) The method as claimed in claim 11, further comprising the act of

navigation of the catheter in the vascular system outside the aneurysm, the act of

navigation is assisted by determining the position of the active locator.
